Micro Peel Information Sheet

One of the more popular facial rejuvenating treatments today is the micro peel.

It is a superficial chemical peel which can smooth and soften your skin, brighten your complexion, minimize pore size, and reduce discoloration, all with no social down time.

Micro peels are the lightest of all chemical peels and, because they work on the outer surface, are standardly not painful.

The procedure uses lactic and glycolic acids which are naturally occurring alpha hydroxyl acids (AHAs) found in fruits and other foods.
